

3DS Install Guide

This document will explain the fastest method to install Photonic Sun or Prismatic Moon, using Luma custom firmware's game patching feature. This requires that you have Luma3DS 7.0 or later on your console already, and that you have a copy of Pokémon Ultra Sun or Pokémon Ultra Moon. This can be digital or physical, and the mod can be uninstalled at any time.

Follow the steps below to install the mod:

1. Choose a version of the hack (Rebalanced or Standard), then right-click that version's folder and select "Download". This should download a single compressed file.
2. Unzip the file.
3. Copy the "luma" folder from the Photonic Sun or Prismatic Moon download pack to the ROOT of your 3DS SD card. **Merge** any **folders** and **replace** any **files** if prompted (you shouldn't need to replace files unless you're updating the hack).
4. Put your SD card back in your 3DS.
5. Press and hold SELECT as you boot your 3DS to access Luma's settings menu.
6. Make sure that "Enable game patching" is checked.
7. Press START to save changes.
8. Install the title update for Pokémon Ultra Sun/Ultra Moon if you haven't already. Your 3DS should prompt you if the update isn't installed. The **update must be installed** for the hack to work.
9. That's it! Launch your game and Kukui should welcome you to whichever version you're playing.

NOTE: Kukui's intro has only been edited for the English language setting. If you want to play in another language but aren't sure if the hack is set up properly, start the game in English first to check for the intro changes. If they're there, chances are the hack is working. You can then reset the game and choose your desired language.

Uninstallation

To uninstall the hack, simply navigate to luma/titles/[title ID]* on your 3DS SD card and delete the [title ID]* folder.

*title ID will be 00040000001B5000 for Ultra Sun or 00040000001B5100 for Ultra Moon.
